Business Analyst Case Study
Author: Alisha Wasim
Company Analysed: Foodpanda
Date: May 14, 2026
Version: 1.0
Status: Portfolio Piece
This document is an independent business analysis portfolio case study created for academic and professional portfolio purposes only. It is not affiliated with or endorsed by Foodpanda Pakistan.

---

1. Company Overview

Foodpanda Pakistan is one of Pakistan's leading online food delivery and quick-commerce platforms. The company launched operations in Pakistan in 2013 under the global Foodpanda brand owned by Delivery Hero. Over the years, Foodpanda expanded beyond food delivery into grocery delivery, pharmacy delivery, and convenience retail services through "pandamart."
The platform operates in major cities including Karachi, Lahore, Islamabad, Rawalpindi, Faisalabad, and Multan. Foodpanda connects three primary stakeholder groups:

1. Customers ordering food or groceries
2. Restaurant partners fulfilling orders
3. Delivery riders responsible for logistics and last-mile delivery

The company primarily follows a commission-based marketplace business model. Revenue streams include:

- Commission charged to restaurant partners per order
- Customer delivery fees
- Sponsored listings and advertisements
- Subscription programs and promotional partnerships

Foodpanda Pakistan maintains a dominant position in the local food delivery market due to its extensive restaurant network, strong brand recognition, and logistics infrastructure. However, increasing customer expectations and operational scaling challenges continue to create process inefficiencies.
Major competitors include:

- Careem Food
- Local restaurant-owned delivery systems
- Emerging quick-commerce startups
- Independent delivery aggregators

As digital ordering adoption grows in Pakistan, operational efficiency, delivery reliability, and partner satisfaction have become critical success factors for sustaining competitive advantage.

2. Business Problem Statement

Problem 1 — Slow and Manual Restaurant Partner Onboarding

Problem Description

Restaurant onboarding at Foodpanda Pakistan involves multiple manual verification stages, including document collection, business validation, menu uploads, and account approvals. The

process lacks workflow automation and centralized tracking, resulting in extended onboarding timelines.

Stakeholders Affected

- Restaurant Partners
- Operations Team
- Business Development Team

Business Impact

- Delayed revenue generation from new partners
- High dropout rate during onboarding
- Reduced restaurant acquisition scalability
- Operational overhead caused by manual follow-ups

Industry benchmarks suggest digitally mature marketplaces can onboard merchants within 1–3 days, while manual onboarding workflows may take over 10–14 days.

Estimated Impact

- Partner acquisition delays reduce potential order volume
- Increased onboarding abandonment risk
- Higher operational staffing costs

Problem 2 — Customer Complaint Resolution Lacks Defined SLA

Problem Description

Customer support complaint handling lacks clearly defined service-level agreements (SLAs). Resolution timelines vary significantly depending on issue type, escalation availability, and support agent workload.

Stakeholders Affected

- Customers
- Customer Support Teams
- Brand Reputation Management

Business Impact

- Increased customer dissatisfaction
- Negative app reviews and ratings
- Customer churn toward competitors
- Loss of customer trust

Research across digital commerce platforms indicates that delayed customer support significantly impacts repeat order behavior and Net Promoter Score (NPS).

Estimated Impact

- Reduced customer retention
- Increased refund costs
- Decline in customer lifetime value

Problem 3 — Inefficient Rider Assignment During Peak Hours

Problem Description

The rider assignment system struggles to optimize delivery allocation during peak demand periods such as weekends, lunch hours, and promotional campaigns. Riders are sometimes assigned inefficient routes or overloaded delivery queues.

Stakeholders Affected

- Delivery Riders
- Customers
- Operations Team
- Restaurant Partners

Business Impact

- Increased delivery delays
- Higher order cancellation rates
- Reduced rider productivity
- Poor customer experience during high-demand periods

Late deliveries directly affect customer satisfaction metrics and platform reliability perception.

Estimated Impact

- Increased compensation/refund expenses
- Reduced order completion efficiency
- Negative impact on customer retention

---

3. Stakeholder Analysis

Stakeholder	Role	Key Pain Point	Impact Level	Engagement Approach
Customer	Places food/grocery orders	Late deliveries and slow complaint handling	High	Surveys, app feedback, customer support analytics
Restaurant Partner	Provides food services	Delayed onboarding and inconsistent order handling	High	Partner meetings, onboarding workshops
Delivery Rider	Executes deliveries	Inefficient rider allocation during peak hours	High	Rider app feedback and operational reporting
Operations Manager	Oversees logistics and support	Manual operational workload	High	KPI dashboards and process optimization reviews
Tech Team	Develops platform systems	Legacy operational bottlenecks	Medium	Agile collaboration and technical requirement sessions
Marketing Team	Drives campaigns and retention	Customer dissatisfaction impacts retention campaigns	Medium	Data sharing and campaign performance reviews

---

4. AS-IS Process Analysis — Restaurant Partner Onboarding

Current Process Flow

Step 1 — Restaurant Application Submission

Restaurant owners submit partnership interest through online forms or sales representatives.

Pain Point:
Applications are sometimes incomplete or submitted through inconsistent channels.

Step 2 — Manual Document Collection
Operations teams manually request business licenses, CNIC copies, bank details, and tax documentation.
Pain Point:
Back-and-forth communication causes delays and document loss risks.

Step 3 — Manual Verification
Staff manually verify documents and validate restaurant authenticity.
Pain Point:
No centralized verification dashboard exists, leading to duplicated efforts.

Step 4 — Menu and Pricing Upload
Restaurant menus are manually formatted and uploaded into the system.
Pain Point:
Formatting inconsistencies and human error delay activation.

Step 5 — Commercial Approval
Internal business teams approve commission rates and operational feasibility.
Pain Point:
Approvals depend heavily on email communication and manual coordination.

Step 6 — Partner Activation
Restaurant account is activated after multiple approvals are finalized.
Pain Point:
Restaurants lack visibility into onboarding status and expected timelines.

Step 7 — Go-Live
Restaurant becomes available to customers.
Pain Point:
Some restaurants experience operational confusion due to limited onboarding training.

---

5. Gap Analysis Table

Gap ID	Current State	Desired State	Business Impact	Priority
GAP-001	Manual onboarding workflow	Automated onboarding portal	Delayed partner activation	High
GAP-002	No complaint SLA tracking	SLA-driven support management	Customer dissatisfaction	High
GAP-003	Limited delivery optimization	AI-assisted rider allocation	Late deliveries	High

Gap ID	Current State	Desired State	Business Impact	Priority
GAP-004	Reactive rating management	Real-time rating monitoring	Brand reputation decline	Medium
GAP-005	Weak peak-hour forecasting	Predictive demand management	Operational inefficiency	High
GAP-006	Limited restaurant analytics	Self-service partner dashboard	Reduced partner engagement	Medium

---

6. TO-BE Process — Proposed Restaurant Onboarding Solution
Improved Future-State Process
Step 1 — Digital Partner Registration Portal
Restaurants submit applications through a standardized onboarding portal.
Improvement:
Centralized and structured application intake.

Step 2 — Automated Document Upload and Validation
System validates mandatory fields and document completeness automatically.
Improvement:
Reduces manual review effort and incomplete submissions.

Step 3 — Digital Verification Workflow
Integrated verification tools validate business information and tax records.
Improvement:
Faster approval cycle with reduced operational dependency.

Step 4 — Automated Menu Upload Templates
Restaurants upload menus using predefined templates or POS integrations.
Improvement:
Minimizes formatting errors and accelerates setup.

Step 5 — Rule-Based Approval Engine
Standard-risk restaurants receive auto-approval based on predefined rules.
Improvement:
Reduces approval bottlenecks.

Step 6 — Real-Time Status Tracking
Partners receive onboarding progress updates through dashboard notifications.
Improvement:
Improves transparency and partner experience.

Step 7 — SLA-Driven Activation
Each onboarding stage includes predefined completion timelines.

Improvement:
Improves accountability and onboarding consistency.

Step 8 — Automated Training and Go-Live Support
Restaurants receive onboarding tutorials and operational guidance automatically.
Improvement:
Improves operational readiness at launch.

---

7. Formal Requirements

Functional Requirements

Requirement ID	Requirement
FR-001	The system shall allow restaurant partners to submit onboarding applications through a centralized digital portal.
FR-002	The system shall validate mandatory documents before application submission.
FR-003	The system shall provide real-time onboarding status tracking to restaurant partners.
FR-004	The system shall automatically route applications based on risk classification rules.
FR-005	The system shall generate SLA alerts for delayed onboarding stages.
FR-006	The system shall allow customers to track complaint resolution progress.
FR-007	The system shall optimize rider allocation using location and traffic data during peak hours.
FR-008	The system shall provide restaurant partners with operational analytics dashboards.

Non-Functional Requirements

Requirement ID	Requirement
NFR-001	The onboarding portal shall support response times under 3 seconds for standard user actions.
NFR-002	The platform shall encrypt sensitive partner and customer data during transmission and storage.
NFR-003	The system shall provide a mobile-friendly and user-friendly interface accessible across major devices.

---

8. Implementation Roadmap

Phase	Timeline	Key Deliverables	Expected Outcome
Phase 1 — Quick Wins	0–3 Months	SLA definitions, onboarding tracking dashboard, complaint categorization	Improved operational visibility
Phase 2 — Core Improvements	3–6 Months	Automated onboarding portal, document validation, workflow automation	Reduced onboarding delays
Phase 3 — Strategic Features	6–12 Months	AI-based rider allocation, predictive peak-hour management, partner analytics dashboards	Improved scalability and delivery efficiency

9. Success Metrics

KPI	Current Baseline (Estimated)	Target After Implementation	Measurement Method
Restaurant Onboarding Time	14 days	3 days	System timestamps
Complaint Resolution Time	48 hours	12 hours	Customer support SLA reports
Late Delivery Rate	22%	10%	Delivery tracking analytics
Restaurant Dropout During Onboarding	30%	10%	Onboarding completion reports
Customer Satisfaction Score	72%	88%	In-app surveys and ratings

Conclusion

This case study demonstrates how structured business analysis techniques can identify operational inefficiencies within a large-scale digital marketplace environment. Through stakeholder analysis, process mapping, gap analysis, and formal requirement definition, several operational improvements were identified for Foodpanda Pakistan.

The proposed solutions focus on automation, SLA-driven operations, and data-driven logistics optimization. If implemented effectively, these improvements could enhance customer satisfaction, improve restaurant partner retention, reduce operational overhead, and strengthen platform scalability in Pakistan’s growing digital commerce ecosystem.
